Chapter 1

Impact Analysis

1.1 Introduction

The Florida iBudget algorithm represents a critical component of the state's developmental disability services infrastructure, determining individual budget allocations for Home and Community-Based Services (HCBS) under the Developmental Disabilities Individual Budgeting waiver program. This system currently serves over 36,000 enrollees, making algorithmic decisions that directly impact the quality of life and service access for individuals with developmental disabilities across Florida. The algorithm's role extends beyond mere budget calculation; it fundamentally shapes how resources are distributed, what services individuals can access, and how person-centered planning principles are implemented in practice.

The enactment of House Bill 1103 in the 2025 legislative session has fundamentally altered the regulatory landscape for iBudget allocation methodologies. This legislation mandates a comprehensive study to review, evaluate, and identify recommendations regarding the current algorithm, with particular emphasis on ensuring compliance with person-centered planning requirements under section 393.0662, Florida Statutes. The bill's requirements extend beyond simple algorithmic refinement, demanding a fundamental reassessment of how statistical methods align with person-centered planning principles and contemporary disability services philosophy.

This analysis addresses the impact of the iBudget recommendations detailed in the [=====] Report.

1.2 Economic Impact Analysis

This section presents the economic impact analysis for each budget allocation model. The conservative budget estimate is defined as the maximum of the actual cost and predicted cost for each case: Conservative = max(Actual, Predicted). This approach ensures adequate funding while accounting for model uncertainty.

1.2.1 Model 1: Impact Analysis

Table 1.1: Model 1: Economic Impact Summary

Metric	Value	Per Client
Sample Size	31,755	—
Total Actual Cost	\$1,329,129,296.59	\$41,855.75
Total Predicted Cost	\$1,192,499,830.73	\$37,553.14
Total Conservative Budget	\$1,540,247,736.03	\$48,504.10
Economic Impact	\$+211,118,439.44	\$+6,648.35
Impact Percentage	15.88%	—
Cases Over Budget	16,744	52.7%
Model R^2 (Test)	0.4300	—
RMSE (Test)	\$33,718.68	—

Table 1.2: Model 1: Economic Impact by Age Group

Age Group	N	%	Mean Actual	Mean Conservative	Impact	Impact %
21-30	8,784	27.7%	\$41,070.28	\$47,817.09	\$+59,263,949.22	+232.99%
31+	20,010	63.0%	\$43,060.14	\$49,775.22	\$+134,368,836.00	+172.22%
Under 21	2,961	9.3%	\$36,046.81	\$41,952.13	\$+17,485,654.21	+237.32%

Table 1.3: Model 1: Economic Impact by Living Setting

Liv Stg	N	Pct	Mean Actual	Mean Conservative	Impact	Impact Pct
FH	17,477	55.0%	\$37,205.20	\$43,222.51	\$+105,164,536.47	+192.16%
ILSL	4,214	13.3%	\$42,100.75	\$49,124.98	\$+29,600,103.46	+191.06%
RH1	8,385	26.4%	\$50,435.94	\$58,063.84	\$+63,959,926.89	+196.32%
RH2	150	0.5%	\$46,116.70	\$53,191.32	\$+1,061,193.95	+159.48%
RH3	1,200	3.8%	\$46,596.24	\$54,030.70	\$+8,921,354.35	+251.49%
RH4	329	1.0%	\$47,851.16	\$55,180.42	\$+2,411,324.31	+182.74%

Tables 1.2 through 1.5 present detailed subgroup analyses, revealing how economic impact varies across age groups, living settings, budget levels, and impact categories. These breakdowns help identify which populations are most affected by prediction errors and where conservative budgeting has the greatest effect.

Figure 1.2-1 presents the distribution analysis for Model 1, showing the distributions of actual costs, predicted costs, prediction errors, and conservative budget estimates.

The conservative budgeting approach for Model 1 would require an additional \$211,118,439.44 (15.88%) compared to actual costs, averaging \$6,648.35 per client. The model under-predicted costs in 52.7% of cases, necessitating the conservative approach to avoid budget shortfalls. Notably, 40.3% of cases (12,782 clients) require large budget increases exceeding 25%, highlighting the importance of the conservative approach for high-risk cases.

Table 1.4: Model 1: Economic Impact by Budget Quartile

Budget Quartile	N	Mean Actual	Mean Conservative	Impact	Impact %
Q1 (Low)	7,939	\$1,879.27	\$12,169.44	\$+81,693,699.40	+715.64%
Q2	7,939	\$15,702.14	\$21,058.00	\$+42,520,187.70	+45.91%
Q3	7,938	\$50,551.63	\$57,290.29	\$+53,491,520.44	+13.65%
Q4 (High)	7,939	\$99,291.06	\$103,499.78	\$+33,413,031.89	+5.18%

Table 1.5: Model 1: Distribution by Impact Level

Impact Level	N	%	Mean Actual	Mean Impact	Impact %
No Change	15,011	47.3%	\$61,312.96	\$+0.00	+0.00%
Small Increase (0-10%)	1,744	5.5%	\$62,059.69	\$+3,019.37	+4.88%
Moderate Increase (10-25%)	2,218	7.0%	\$54,251.65	\$+9,218.42	+17.18%
Large Increase (>25%)	12,782	40.3%	\$14,097.81	\$+14,505.26	+481.05%

RH3	1,293	3.8%	\$73,103.82	\$88,315.72	\$+19,668,978.98	+405.96%
RH4	350	1.0%	\$52,960.98	\$62,907.79	\$+3,481,383.34	+344.13%

Tables 1.7 through 1.10 present detailed subgroup analyses, revealing how economic impact varies across age groups, living settings, budget levels, and impact categories. These breakdowns help identify which populations are most affected by prediction errors and where conservative budgeting has the greatest effect.

Figure 1.2-2 presents the distribution analysis for Model 2, showing the distributions of actual costs, predicted costs, prediction errors, and conservative budget estimates.

The conservative budgeting approach for Model 2 would require an additional \$421,765,383.50 (27.68%) compared to actual costs, averaging \$12,342.06 per client. The model under-predicted costs in 61.6% of cases, necessitating the conservative approach to avoid budget shortfalls. Notably, 49.5% of cases (16,916 clients) require large budget increases exceeding 25%, highlighting the importance of the conservative approach for high-risk cases.

Table 1.9: Model 2: Economic Impact by Budget Quartile

Budget Quartile	N	Mean Actual	Mean Conservative	Impact	Impact %
Q1 (Low)	8,544	\$1,858.29	\$22,770.43	\$+178,673,372.09	+1,548.90%

Tables 1.22 through 1.25 present detailed subgroup analyses, revealing how economic impact varies across age groups, living settings, budget levels, and impact categories. These breakdowns help identify which populations are most affected by prediction errors and where conservative budgeting has the greatest effect.

Figure 1.2-5 presents the distribution analysis for Model 5, showing the distributions of actual costs, predicted costs, prediction errors, and conservative budget estimates.

The conservative budgeting approach for Model 5 would require an additional \$387,410,899.44 (25.43%) compared to actual costs, averaging \$11,336.75 per client. The model under-predicted costs in 57.8% of cases, necessitating the conservative approach to avoid budget shortfalls. Notably, 44.7% of cases (15,292 clients) require large budget increases exceeding 25%, highlighting the importance of the conservative approach for high-risk cases.

Table 1.24: Model 5: Economic Impact by Budget Quartile

Budget Quartile	N	Mean Actual	Mean Conservative	Impact	Impact %
Q1 (Low)	8,544	\$1,858.29	\$24,077.75	\$+189,843,071.70	+1,665.49%
Q2	8,543	\$16,299.64	\$28,270.83	\$+102,269,877.17	+105.13%
Q3	8,543	\$53,447.49	\$61,133.08	\$+65,658,018.28	+14.93%
Q4 (High)	8,543	\$106,733.76	\$110,203.26	\$+29,639,932.29	+4.24%

Tables 1.32 through 1.35 present detailed subgroup analyses, revealing how economic impact varies across age groups, living settings, budget levels, and impact categories. These breakdowns help identify which populations are most affected by prediction errors and where conservative budgeting has the greatest effect.

Figure 1.2-7 presents the distribution analysis for Model 9, showing the distributions of actual costs, predicted costs, prediction errors, and conservative budget estimates.

The conservative budgeting approach for Model 9 would require an additional \$789,582,366.08 (19.81%) compared to actual costs, averaging \$7,938.29 per client. The model under-predicted costs in 59.4% of cases, necessitating the conservative approach to avoid budget shortfalls. Notably, 45.1% of cases (44,878 clients) require large budget increases exceeding 25%, highlighting the importance of the conservative approach for high-risk cases.

Table 1.34: Model 9: Economic Impact by Budget Quartile

Budget Quartile	N	Mean Actual	Mean Conservative	Impact	Impact %

1.2.8 Comparative Analysis Across Models

Table 1.36 presents a comprehensive comparison of economic impacts across all budget allocation models.

Table 1.36: Comparative Economic Impact Analysis Across All Models

Model	Samples	R^2 Test	Economic Impact	Impact %	Over Budget %
Model 1	31,755	0.4300	\$+211,118,439.44	+15.88%	52.7%
Model 2	34,173	0.4386	\$+421,765,383.50	+27.68%	61.6%
Model 3	34,173	0.4534	\$+291,296,189.01	+19.12%	52.8%
Model 4	34,173	0.4746	\$+383,948,908.96	+25.20%	58.2%
Model 5	34,173	0.4772	\$+387,410,899.44	+25.43%	57.8%
Model 6	34,173	-0.3517	\$+899,694,967.40	+59.05%	69.5%
Model 9	99,465	0.6412	\$+789,582,366.08	+19.81%	59.4%

1.3 Key Insights

- Model 9 achieves the highest predictive accuracy with $R^2 = 0.6412$.
- Model 6 requires the largest conservative budget adjustment at 59.05%.
- The conservative budgeting approach ensures adequate funding to cover cases where the model under-predicts actual costs.
- Economic impact percentages reflect both model accuracy and the degree of systematic under- or over-prediction.
- Subgroup analyses reveal differential impacts across age groups, living settings, and budget levels, providing insights for targeted policy interventions.
- Impact level distributions identify high-risk cases requiring substantial budget adjustments beyond model predictions.
